oct 5 2012 by using a colon in the list index you are asking for a slice which is always another list in python you can assign values to both an individual item in a list and to a slice of the list

i have a piece of code here that is supposed to return the least common element in a list of elements ordered by commonality def getsingle arr from collections import

counter c counte

the first is creating a slice normally often used for getting just part of a list which happens to contain the entire list and thus is effectively a copy of the list the second list is using the actual

nov 2 2010 when reading list is a reference to the original list and list shallow copies the list when assigning list re binds the name and list slice assigns replacing what was previously in the list

the first way works for a list or a string the second way only works for a list because slice assignment isn t allowed for strings other than that i think the only difference is speed it looks like it s a little

the notation list means a list of something but i m not saying what since the code in test works for any kind of object in the list this works as a formal method parameter using a type parameter

jul 19 2014 you can access the elements in a list of lists by first specifying which list you re interested in and then specifying which element of that list you want for example 17 is element 2 in list 0

the operator in python seems to be operating unexpectedly on lists can anyone tell me what is going on here class foo bar def init self x self bar x clas

aug 2 2013 list integer might lead to devastating memory fragmentation java maintains constant pool for some integers in 0 128 range but generally java allocates a

new object for each 32 bit

if your list of lists comes from a nested list comprehension the problem can be solved more simply directly by fixing the comprehension please see how can i get a flat result from a list
